Renewable energy at our Skövde plant

Challenged by investing in multiple technologies?

Around the world, OEMs are scaling down their traditional powertrain operations to focus their investments on differentiators that meet customer demands, like digital experience and electrification.

With emissions and safety regulations requiring significant capital and engineering investment, it can be hard to make the sums add up. Your investments in powertrain solutions won't give you competitive advantage. And chances are, they won't look great on your balance sheet.

By outsourcing your hybrid and ICE powertrain operations, you could slash your operating costs. You'd free up cash and resources to invest in connectivity, autonomous drive, safety and electrification. And you'd become more competitive and profitable.

It's time for a new kind of powertrain solution.

Introducing Aurobay

Aurobay brings together Volvo Cars' powertrain business with Geely to develop and produce world-class powertrain solutions. Higher performance at lower costs and a before low-carbon footprint.

We create value with compact, hybrid-ready engines that are highly efficient and best-in-class for emissions. They're based on award-winning modular architecture that adapts easily to a wide range of vehicles - offering outstanding performance at optimal cost of ownership.

And with options for R&D, manufacturing engineering and contract manufacturing, you can minimize your risk and maximize efficiency and value.

We want to continue to set the pace in powertrain technology - optimizing costs and efficiency and pushing the environmental impact towards zero.

Aurobay at a glance

- World-class powertrain solutions, services and contract manufacturing
- Formed from the merger of Volvo Cars' powertrain business with Geely
- Manufacturing, R&D and sales capabilities
- Focused on developing and producing next-generation combustion engines and hybrid solutions
